# Assignment 7: GLMs (Linear Regressios, ANOVA, & t-tests)

Andrea Gonzalez Natera

## OVERVIEW

This exercise accompanies the lessons in Environmental Data Analytics on generalized linear models.

### Directions

1. Change "Student Name" on line 3 (above) with your name.
2. Work through the steps, **creating code and output** that fulfill each instruction.
3. Be sure to **answer the questions** in this assignment document.
4. When you have completed the assignment, **Knit** the text and code into a single PDF file.
5. After Knitting, submit the completed exercise (PDF file) to the dropbox in Sakai. Add your last name into the file name (e.g., "Fay_A06_GLMs.Rmd") prior to submission.

The completed exercise is due on Tuesday, March 2 at 1:00 pm.

### Set up your session

1. Set up your session. Check your working directory. Load the tidyverse, agricolae and other needed packages. Import the *raw* NTL-LTER raw data file for chemistry/physics (`NTL-LTER_Lake_ChemistryPhysics_Raw.csv`). Set date columns to date objects.

2. Build a ggplot theme and set it as your default theme.

```
#1
#Working Directory
getwd()
```

```

        legend.position = "bottom",
        legend.text = element_text(size = 10),
        legend.title = element_text(size = 12),
        plot.title = element_text(hjust = 0.5))
theme_set(mytheme)
```

### Simple regression

Our first research question is: Does mean lake temperature recorded during July change with depth across all lakes?

3. State the null and alternative hypotheses for this question: > Answer: H0: There ins no correlation between mean lake temperature recorded in July and lake depth across all lakes. Ha: Mean lake temperature recorded in July changes with depth across some lakes

4. Wrangle your NTL-LTER dataset with a pipe function so that the records meet the following criteria:

- Only dates in July.
- Only the columns: `lakename`, `year4`, `daynum`, `depth`, `temperature_C`
- Only complete cases (i.e., remove NAs)

5. Visualize the relationship among the two continuous variables with a scatter plot of temperature by depth. Add a smoothed line showing the linear model, and limit temperature values from 0 to 35 °C. Make this plot look pretty and easy to read.

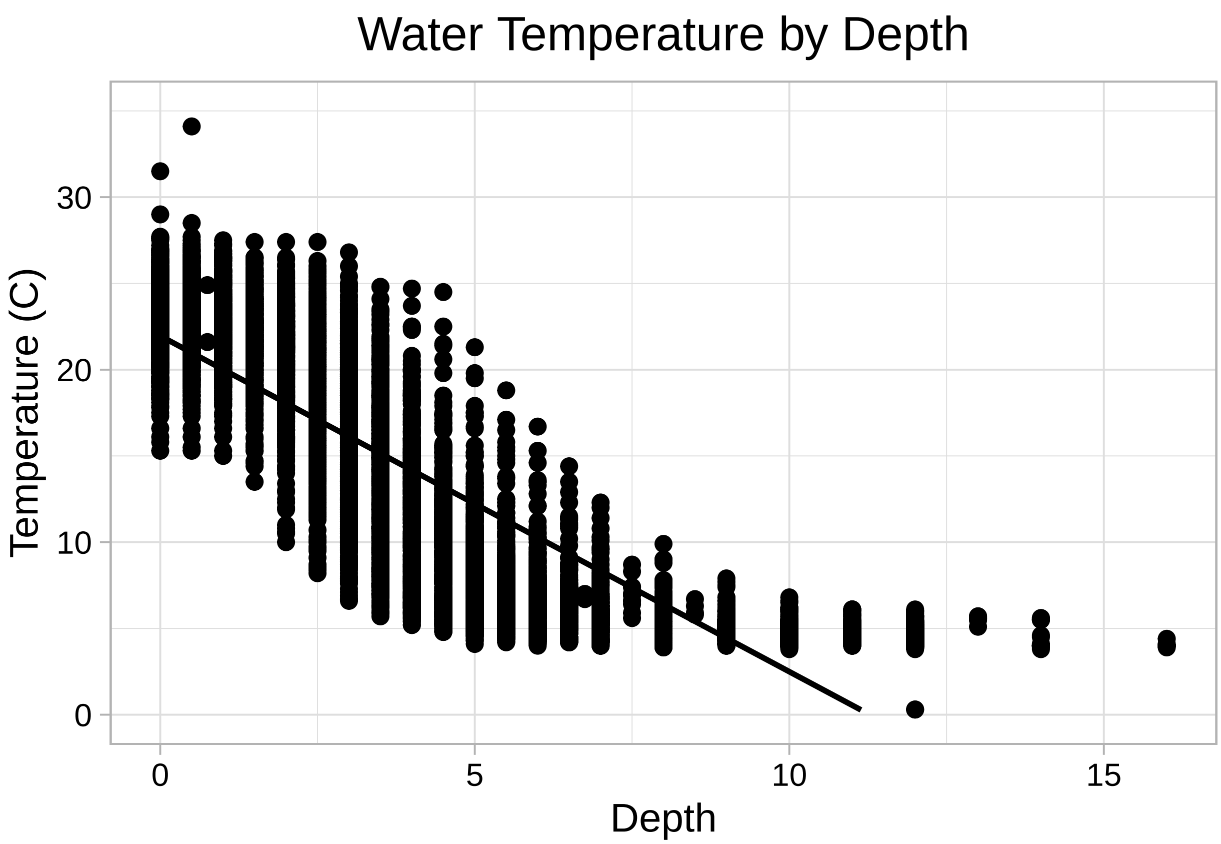
```
#4
NTL_clean <- NTL %>%
  mutate(month = month(sampledate)) %>%
  filter(month == 7) %>%
  select(lakename, year4, daynum, depth, temperature_C)%>%
  na.omit()
```

```
#5

plot1 <- ggplot(NTL_clean,aes(x = depth, y = temperature_C))+
  geom_point(size = 2.5)+
  ylim(0,35) +
  labs(y = "Temperature (C)", x= "Depth") +
  ggtitle("Water Temperature by Depth")+
  geom_smooth(method = lm, se=FALSE, color="black")+
  mytheme
print(plot1)
```

```
## `geom_smooth()` using formula 'y ~ x'
```

```
## Warning: Removed 24 rows containing missing values (geom_smooth).
```



6. Interpret the figure. What does it suggest with regards to the response of temperature to depth? Do the distribution of points suggest anything about the linearity of this trend?

   Answer: There seems to be a negative correlation between water depth and water temperature. The distribution of points suggest that the relationship is polynomial.

7. Perform a linear regression to test the relationship and display the results

```
#7
TempDepth.regression <- lm(data = NTL_clean, temperature_C ~ depth)
summary(TempDepth.regression)
```

```
##
## Call:
## lm(formula = temperature_C ~ depth, data = NTL_clean)
##
## Residuals:
##     Min      1Q  Median      3Q     Max
## -9.5173 -3.0192  0.0633  2.9365 13.5834
##
## Coefficients:
##             Estimate Std. Error t value Pr(>|t|)
## (Intercept) 21.95597    0.06792   323.3   <2e-16 ***
## depth       -1.94621    0.01174  -165.8   <2e-16 ***
## ---
## Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
##
## Residual standard error: 3.835 on 9726 degrees of freedom
## Multiple R-squared:  0.7387, Adjusted R-squared:  0.7387
## F-statistic: 2.75e+04 on 1 and 9726 DF,  p-value: < 2.2e-16
```

8. Interpret your model results in words. Include how much of the variability in temperature is explained by changes in depth, the degrees of freedom on which this finding is based, and the statistical significance of the result. Also mention how much temperature is predicted to change for every 1m change in depth. The result is very statistically significant.

   Answer: There is a negative correlation between mean temperature and depth.For every meter change in depth there is a change of -1.94 degrees in temperature. Up to 73.87% of the variability in temperature can be explained by changes in depth using 9726 deggrees of freedom.

---

## Multiple regression

Let's tackle a similar question from a different approach. Here, we want to explore what might the best set of predictors for lake temperature in July across the monitoring period at the North Temperate Lakes LTER.

9. Run an AIC to determine what set of explanatory variables (year4, daynum, depth) is best suited to predict temperature.

10. Run a multiple regression on the recommended set of variables.

```r
#9
TempModel <- lm (data = NTL_clean, temperature_C ~ depth + year4 + daynum )
summary(TempModel)
```

```
##
## Call:
## lm(formula = temperature_C ~ depth + year4 + daynum, data = NTL_clean)
##
## Residuals:
##     Min      1Q  Median      3Q     Max
## -9.6536 -3.0000  0.0902  2.9658 13.6123
##
## Coefficients:
##              Estimate Std. Error  t value Pr(>|t|)
## (Intercept) -8.575564   8.630715   -0.994  0.32044
## depth       -1.946437   0.011683 -166.611  < 2e-16 ***
## year4        0.011345   0.004299    2.639  0.00833 **
```

```

## Multiple R-squared:  0.7412, Adjusted R-squared:  0.7411
## F-statistic:  9283 on 3 and 9724 DF,  p-value: < 2.2e-16
```

11. What is the final set of explanatory variables that the AIC method suggests we use to predict temperature in our multiple regression? How much of the observed variance does this model explain? Is this an improvement over the model using only depth as the explanatory variable?

    Answer: The final set of explanatory variables are depth year4 and daynum. This model explains

74% of the observed variance. It is a small improvement over the model using only depth as the explanatory variable but nothing very significant.

---

## Analysis of Variance

12. Now we want to see whether the different lakes have, on average, different temperatures in the month of July. Run an ANOVA test to complete this analysis. (No need to test assumptions of normality or similar variances.) Create two sets of models: one expressed as an ANOVA models and another expressed as a linear model (as done in our lessons).

```

```

13. Is there a significant difference in mean temperature among the lakes? Report your findings.

    Answer: There is a statistical significant difference in mean temperature among lakes

14. Create a graph that depicts temperature by depth, with a separate color for each lake. Add a geom_smooth (method = “lm”, se = FALSE) for each lake. Make your points 50 % transparent. Adjust your y axis limits to go from 0 to 35 degrees. Clean up your graph to make it pretty.

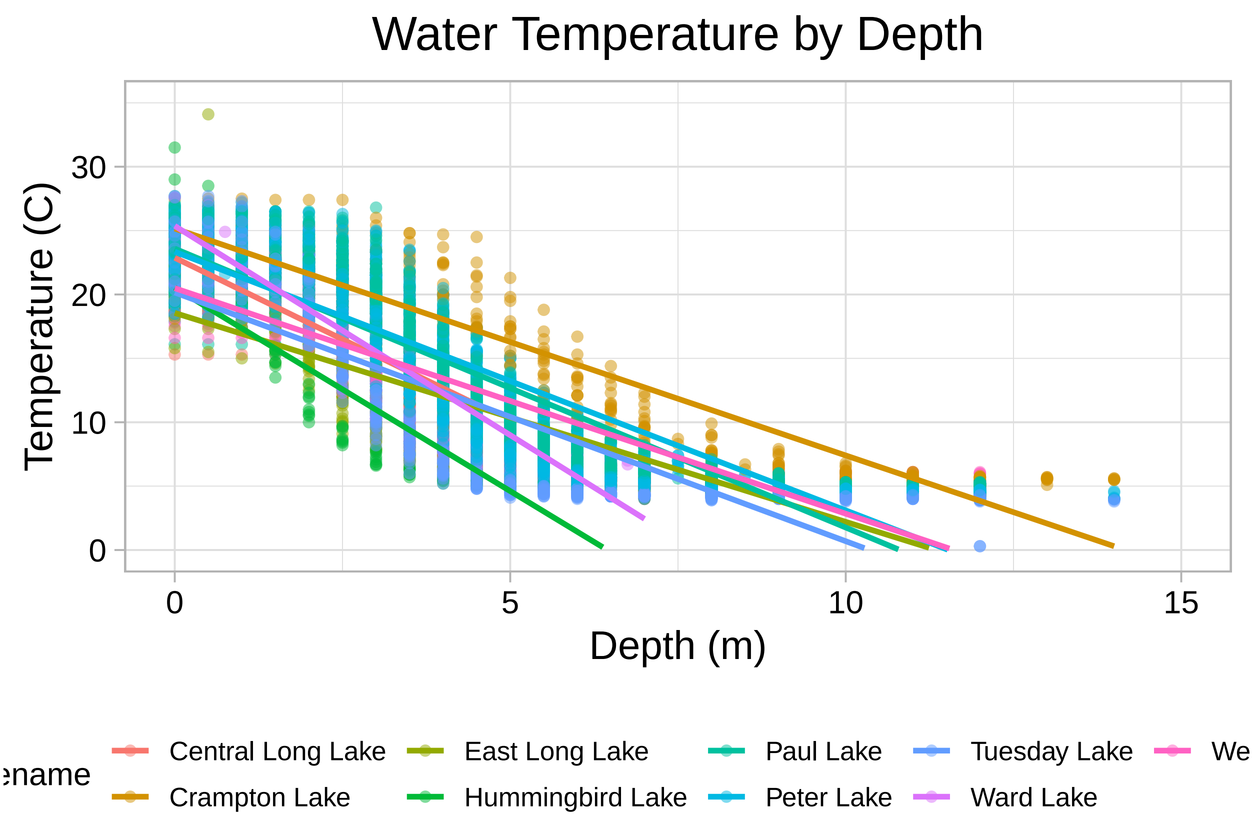
```r
#14.
MeanTempPlot <- ggplot(NTL_clean, aes(x = depth, y = temperature_C, color = lakename))+
  geom_point(alpha = 0.5 )+
  ylim(0,35) +
  xlim(0,15) +
  labs(y = "Temperature (C)", x= "Depth (m)") +
  ggtitle("Water Temperature by Depth")+
  geom_smooth(method = lm, se=FALSE) +
  mytheme
print(MeanTempPlot)
```

```
## `geom_smooth()` using formula 'y ~ x'

## Warning: Removed 9 rows containing non-finite values (stat_smooth).

## Warning: Removed 9 rows containing missing values (geom_point).

## Warning: Removed 58 rows containing missing values (geom_smooth).
```



15. Use the Tukey's HSD test to determine which lakes have different means.

```r
#15
TukeyHSD(Temp.Lakes.anova1)
```

```
##   Tukey multiple comparisons of means
##     95% family-wise confidence level
##
## Fit: aov(formula = temperature_C ~ lakename, data = NTL_clean)
##
```

```
## $lakename

16.From the findings above, which lakes have the same mean temperature, statistically speaking, as Peter Lake? Does any lake have a mean temperature that is statistically distinct from all the other lakes?

> Answer: Paul lake and Ward Lake have statistically similar mean temperatures than Peter lake. Central Long lake's mean temperature is statistically different from all other lakes but it is closest to Crampton Lake.

17. If we were just looking at Peter Lake and Paul Lake. What's another test we might explore to see whether they have distinct mean temperatures?

    Answer: We might do a two sample t-test
